

The new **FM RADIO ANTENNA CABLE FOR BT LINE** **(Midland code C1224 or R74274)**

The BT line models having the integrated FM radio are the following:

BT Next Conference (code C1141/C1141.01)

BTX1FM (code C1142/C1142.01)

BTX2FM (code C1143/C1143.01)

BT Next (code C969/C969.01): some of this devices can still have the previous audio kit version with one unique connector on the right speaker (long cable). In this case the antenna has to be connected to that connector.

This accessory has been added to our line as the **added antenna improves the reception of the radio signal, improving the audio and the station research.**

The added antenna has to be connected to the audio kit available with the BT Intercom device (our code C1008.01).

How to mount the antenna

Open the red connector for the left speaker (short cable), insert the antenna and close the speaker again, as per attached pictures.

The cable of the antenna has to be put inside the helmet, as it is done for the audio kit cables.

The more the cable is straight, the more the performance of the antenna increases.
